Introduction to
Internet
Computer
Project 3

During this project, I used Brackets to edit my HTML, CSS, and JavaScript. This time around, I was more comfortable using Bootstrap to make my project easier on the eye. My app has been tested on both Google Chrome and Microsoft Edge and work as expected. For this project, I had to touch JavaScript for the first time. To my surprise, It wasn't hard at all. The language is slightly different from C++ and has it's on capabilities but with my prior knowledge of C++, I was able to move though things much faster.

Since this was my second time using Bootstrap, it wasn't as time consuming. I did have to refer to my last project when I came up against errors, which cleared things up fast. Overall, this project gave me a good idea of what JavaScript can do for a website and how it can make it more dynamic for the user.
