Project 2

For this project, I used the Brackets Editor. It's easy for me to use and it doesn't have a lot of complicated features. I tested my webpage on google chrome and Microsoft Edge and both looked identical. Learning bootstrap was a bit uncomfortable for me at first. I've never had to go searching through code and figure out which line of code represents what on the webpage. As of right now, I would prefer to try and use CSS from scratch rather than getting a template. While I admit my webpage does look nicer with bootstrap, I would have enjoyed trying to build a website from scratch and really learning and understanding everything that goes into it. The most time-consuming part of this project was understanding what bootstrap does. It took me a while to understand how all the links work as well as the way things are styled. Overall, I definitely learn a lot for this project from reading out of the Zybook but it was difficult for me to try and implement everything I learned because it would mess up with the whole structure of the website. I ended up deleting a lot of pictures and buttons because it was starting to get ugly. But, I'm sure it was vital in the learning process as bootstrap seems to be a more convenient way to make a webpage.
