Computing
Project 6

I honestly had a lot of fun doing this project. PHP gives me a lot of freedom to do things that I want and after reading the chapters for this assignment, I understood a lot of key ideas like POST and GET. I also feel as if my CSS abilities are getting better as well. I really enjoyed adding the functionality of making sure that the user input a proper zip code. For this assignment, I didn't use bootstrap because I still want to practice my own skills and understanding of CSS. By doing this, I grew more comfortable with splitting the screen with two div boxes. Brackets was used to edit the code and I had no problem with it this time. One problem that I did run into was forgetting to upload my CSS file to the server. When I didn't do that, none of my CSS showed up and it took me a couple of minutes to figure it out. This project was probably my favorite project so far because I could practice a lot of things that I've already learned and new topics as well
