Introduction to Internet Computing

Project 4

During this project, I used Brackets to edit my website. I got the main functionalities from 10.8 of the Zybook we use in class, as instructed. I was able to add a functionality that gave the user the option to use a dark-mode on the website. I was also able to add some music to make the website more likable. A lot of the text was aligned, and I tried to make it look more friendly.

I purposely chose not to use Bootstrap on this project because I wanted to see what I could do from scratch. To be honest, it is going to take a lot of work to get to the level of Bootstrap-like websites. This is a learning process so I would like to try to make my websites from my own code every once and a while and see how they compare to Bootstrap selections
